TITLE: Studies on the derivatives of phosphonic and phosphonous acids. XIX. Study of
the polymerization of the butyl- and allyl-isopropenyl esters of ethylphosphonic acid

SOURCE: Karbotsepnye vy'sokomolekulyarnye soyedineniya (Carbon-chain macro-
molecular compounds); sbornik statey. Moscow, Izd-vo AN SSSR, 1963, 160-165

TOPIC TAGS: phosphonic acid, phosphonous acid, butyl isopropenyl ester, allyl
isopropenyl ester, acodiisobutyrone, copolymerization, styrene, methylmethacrylate,
acrylonitrile ethylphosphonic acid

ABSTRACT: The effect of the isopropenyl group on the polymerizability of esters was
investigated by carrying out block polymerization of ethylphosphonates in the presence
of 0.5, 1, 2, 3 and 5 mol. % acodiisobutyrone as an initiator at 50°C for 150 hours or
at 70°C for 50 hours, in the presence of 1 mol. % benzoyl peroxide at 50°C for 90 hours,
and in the presence of 2 mol. % titanium tetrachloride in a methylene chloride medium at
50°C. All experiments were carried out in an atmosphere of nitrogen. The allyl iso-
propenyl ester of ethyl phosphonic acid yielded a rubbery polymer which was insoluble in

Card

1/2

ACCESSION NR: AT4020707

the common organic solvents but soluble in hot dimethylformamide. The characteristic viscosity of the block polymer in dimethylformamide was 0.054. With 0.5% azodi-isobutyronitrile, a low-molecular viscous polymer was obtained. With higher amounts of this initiator and with benzoyl peroxide, a solid polymer was formed, although in the presence of the latter the reaction proceeded more slowly. The butylisopropenyl ester of ethylphosphonic could not be polymerized. In order to modify the properties of polystyrene, polymethylmethacrylate and polyacrylonitrile, both ethylphosphonic acid esters were copolymerized with these polymers at 50-70C in nitrogen, for 18 hours (for methylmethacrylate) up to 200 hours (for styrene), in the presence of 1 mol. % axodiisobutyronitrile based on the amount of monomers. The experimental data are tabulated, and the copolymers obtained are described. The thermomechanical properties of these copolymers are shown in graphs of deformation against temperature. Orig. art. has: 3 figures and 2 tables.

ABSTRACT: The reaction of RP(SR)₂ (I; always R=C₂H₅) with R'X produced the adducts [RR'P(SR)₂]X (II), which on heating convert into RR'P(S)SR (III), and in many cases into RR'PS (IV) (a few). Thermal decomposition of II in the presence of R'X produces III and IV in about the same proportions. These results do not confirm a proposed mechanism of the reaction of I with R'X with detachment of RSB_r from II (RZhKhim, 1958, No. 8, 25246). To 50 g of I in a CO₂ atmosphere is added 38.9 g of CH₃I at 22°, after ~16 hr the crystals of II (R = CH₃, X = I) (IIa) are washed with ether, and III, 74% (R' = C₂H₅) (IIIa) is separated from the liquid part (here and further on, the yield in % is given with the substance). 30 g IIa is carefully melted, RI, 92 is driven off, and IIIa, 77 is separated. 20 g I and 11 g CH₃Br at -10° are sealed into a tube, and 2 days later (at 20-22°) II is removed (R' = Me, X Br), and IIIa, 72 is isolated. 20 g I and 10.77 g RBr are heated in a tube for 4 hours at 140-150°, and crystals of R₃PS,

TITLE: Investigations in the series of derivatives of phosphinic and phosphinous acids. XXIII. Synthesis and certain properties of phosphorylated acetals and aldehydes with aliphatic radicals

SOURCE: Zhurnal obshchey khimii, v. 34, no. 8, 1964, 2589-2594

TOPIC TAGS: phosphinic acid, ester, halogenated organic compound, organic phosphorus compound, aldehyde, acetaldehyde, aliphatic hydrocarbon, phosphorus

Abstract: The Arbuzov rearrangement of esters of trivalent phosphorus with halogen-substituted acetals was used to produce phosphorylated acetals: the reaction of triethyl phosphite, the diethyl ester of ethylphosphinous acid, and the ethyl ester of diethylphosphinous acid with diethyl acetals of bromoacetic and beta-chloropropionic aldehydes was studied. A series of phosphorylated acetals was synthesized through this reaction, and the corresponding aldehydes were produced by their hydrolysis. The structures of the phosphorylated acetals and aldehydes were confirmed by analysis.

SOURCE: Zhurnal obshchey khimii, v. 34, no. 8, 1964, 2595-2599

TOPIC TAGS: phosphinic acid, ester, halogenated organic compound, organic phosphorus compound, aldehyde, acetaldehyde, hydrolysis, aromatic hydrocarbon

Abstract: Phosphorylated acetals and aldehydes with aromatic radicals were produced by the reaction of esters of phenyl-, p-tolyl-, p-ethylphenyl-, p-isopropylphenyl-, and diphenylphosphinous acids with bromoacetaldehyde and beta-chloropropionaldehyde. The reaction of the ethyl ester of phenyl-phosphinous acid with beta-chloropropionaldehyde indicated that the ethyl ester of gamma-ethoxyallylphenylphosphinic acid is formed at higher temperatures, instead of phenylethoxyphosphinylpropionic acetal. Hydrolysis of some of the synthesized acetals produced phosphinylaldehydes, and reaction of the latter with 2,4-dinitrophenylhydrazine produced the corresponding hydrazones.

SOURCE: Zhurnal obshchey khimii, v. 34, no. 10, 1964, 3243-3247

TOPIC TAGS: chemical kinetics, reaction rate, chemical reaction, reaction mechanism, organic phosphorus compound

Abstract: The kinetics of the decomposition of the aliphatic intermediate products of the Arbuzov rearrangement was studied by two methods: 1) the decomposition of the crystalline intermediate products, in which observations of the rate were conducted according to the amount of alkyl halide liberated, and 2) the reaction kinetics of the decomposition of the intermediate product in solutions of nitromethane by measurement of the electric conductivity. The decomposition of the intermediate product (second phase of the rearrangement) was found to be a first-order reaction. Orig. art. has 3 figures, 3 formulas, and 2 tables.

TITLE: Polarographic behavior and structure of certain phosphorylated aldehydes
in aqueous solutions

SOURCE: AN SSSR. Doklady, v. 158, no. 2, 1964, 423-426

TOPIC TAGS: aldehyde, polarography, phosphorus, aqueous solution

Abstract: The polarographic reduction of phosphorylated aldehydes with the
general formula

where $R' = C_2H_5, C_2H_5O, C_6H_5, p\text{-}CH_3-C_6H_4, p\text{-}C_2H_5-C_6H_4, p\text{-}iso-C_3H_7-C_6H_4,$
 $p\text{-Cl-C}_6H_4; R'' = C_2H_5, C_2H_5O,$ was systematically studied for the first
time. Their polarographic activity was due to the aldehyde group rather
than the phosphoryl group. Two portions could be distinguished on the
polarographic waves of aqueous solutions of the compounds studied: the
portion of the curve of the base of the wave possessed the character of an

Card 1/2

L 19607-65

ACCESSION NR: AP5003150

adsorption prewave; in the middle pH region, as the concentration of the substance in solution was increased to $7 \cdot 10^{-3}$ mole/liter, the height of the reduction wave increased in proportion to the concentration, the height of the prewave decreasing. The temperature coefficient was 4-5% per degree. The value of the electroreduction current was determined by the equilibrium concentration of the free aldehyde form, the position of the equilibrium of the aldehyde form with the hydrated form in turn depending on the pH of the solution. The principle of linear free energy was used for a quantitative evaluation of the influence of substituents at the phosphorus atom on the reactivity of the aldehyde group; it was found that satisfactory correlation of the values of $E_{1/2}$ and the sum of the sigma constants of the substituents is observed only if the values of the Hammett constants are used, while if the constants of the substituents according to Taft and Kabachnik are used, no such pattern is manifested. Orig. art. has 2 formulas, 4 graphs, and 1 table.

TITLE: Investigation in the series of derivatives of phosphinic and phosphinous acids. XXXII. Interaction of orthoformic esters with incomplete esters of phosphorous and phosphinous acids

SOURCE: Zhurnal obshchey khimii, v. 35, no. 9, 1965, 1595-1598

TOPIC TAGS: phosphorous acid, phosphinic acid, ester, tautomerism, hydrolysis

ABSTRACT: The reaction of orthoformic esters with dialkylphosphorous acids was extended to other phosphorous and phosphinous compounds: diethylthiophosphorous acid, monoesters of ethyl- and p-chlorophenylphosphinous acids, and diethylphosphinous acid (diethylphosphine oxide). Replacement of alkoxyl groups at the phosphorous atom by alkyl groups produced a drop in the conversion of the starting materials; replacement of the ethoxyl group by the p-chlorophenyl group resulted in an increase in the conversion. The phosphorylated formals obtained are characterized. A reaction mechanism is proposed based on tautomerism of incomplete esters of phosphorus and phosphinous acids; the authors consider the participation of the pentavalent

Card 1/2

L 25596-66

ACC NR: AP6016694

form in the reaction more probable. The hydrolysis of phosphine formals and thiophosphine formals was studied. The phosphine formals were more stable to acid hydrolysis than the acetals. Hydrolysis under more rigorous conditions (heating in a tube with 5% hydrochloric acid at 117° or in a flask with 7% hydrochloric acid at 125°) led to cleavage of the C-P bond, liberating the initial diethylphosphorous acid, alcohol, and ethyl formate. A reaction mechanism is proposed for the hydrolysis of phosphine formals, involving the formation of an intramolecular hydrogen bond between the hydrogen of the hydroxyl and the phosphoryl oxygen. SOURCE: Zhurnal obshchey khimii, v. 35, no. 11, 1965, 2038-2042
TOPIC TAGS: phosphinic acid, acetal, hydrolysis, ester, organic synthetic process, hydrazine derivative, nonmetallic organic derivative, phosphorylation
ABSTRACT: The corresponding phosphorylated acetals were produced by the reaction of the ethyl esters of phenyl-, p-tolyl-, and p-chlorophenyl-phosphinous acids with bromoacetic and beta-chloropropionic acetals. The reaction was found to proceed only under more rigorous conditions (200-250°), and led to the formation of esters of ethoxyvinylphosphinous acids instead of the expected phosphorylated acetals, which the authors postulate as unstable intermediates in the reaction. Hydrolysis of the acetals and unsaturated esters synthesized under mild conditions yielded phosphorylaldehydes, all of which reacted with 2,3-dinitrophenylhydrazine to give the corresponding hydrazones.

XXXIII. Preparation, rearrangement, and oxidation of esters of phosphorus acids with allyl radicalsSOURCE: Journal of Inorganic Chemistry, v. 36, no. 2, 1966, 314-319
TOPIC TERM: ester, reaction, nonmetallic organic derivative, phosphinic acid,

epoxide, oxide formation, spectrum analysis, molecular structure

ABSTRACT: The diallyl ester of allylphosphinous acid was synthesized by the action of allyldichlorophosphine on allyl alcohol in the presence of triethylamine, and some of its reactions, proceeding with the participation of the trivalent phosphorus atom, were studied. Diallyl esters of allylthio- and -seleno-phosphinic acids were prepared by the addition of sulfur and selenium to the diallyl ester of allylphosphinous acid; the corresponding esters of allyl- and diallylphosphinic acids were prepared by rearrangement with chloral and allyl bromide. Mono-, di-, and triepoxide derivatives of secondary phosphinic acids were prepared by oxidation of esters of allylethyl- and diallyl-phosphinic acids with acetyl peroxide. Proton magnetic resonance spectra established the structures of these epoxides. The epoxy compounds and rearrangement products are being tested for biological activity. Orig. art.

TITLE: The kinetics of the thermal decomposition of solids

CITED SOURCE: Sb. tr. Gos. in-ta prikl. khimii, vy*p. 49, 1962, 170-182

TOPIC TAGS: kinetics, thermal decomposition, solid state decomposition, activation energy, inorganic crystal

TRANSLATION: It has been shown that the Yerofeyev equation which is used in practice does not correctly describe the process of thermal degradation of inorganic crystals since it holds only for a reaction in a continuous medium with formation of a nucleus in the volume. During the thermal decomposition of crystals, nuclei are formed only on the surface. A solution was obtained to the problem of calculating the probability of a reaction at a given point in the body for the general case with a body of any shape and an arbitrary law for the formation of nuclei not only on the surface, but also throughout the volume of the body. The exact solution obtained is analyzed for two limiting cases. It is shown that the

Card 1/2

ACCESSION NR: AR4025721

total energy of activation depends not only on the nature of the compound but also on the dimensions and shape of the particles. By means of the similitude theory, two dimensionless variables are found which define the process of thermal decomposition Authors' summary.

TITLE: Noise Characteristics of the Tu-104 Airliner (Kharakte-
ristiki shuma, sozdavayemogo samoletom Tu-104)

PERIODICAL: Grazhdanskaya aviatsiya, 1958, Nr 2, pp 19-21 (USSR)

ABSTRACT: The article is a report on the results of noise level tests carried out in the State Scientific Research Institute with the Tu-104 jet and the Il-14 conventional airliners. The results of tests are compared with each other and with those of the French Caravelle jet aircraft. The conclusion is that the Tu-104, flying at 375 m. altitude and rated engine speed creates a noise level at a listening station placed 4,500 m. from the take-off point equal to that of the Il-14 plane passing at an altitude of 200 m. The noise level of the Tu-104

Card 1/2

AUTHOR: Razumov, I. A.

TITLE: The effect of circular horizontal vibrations during the solidification of the metal on its quality

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 2, 1962, 9, abstract 2G53 (V sb. "Novoye v liteyn. proiz-ve. no. 3", Gor'kiy, 1960, 114-119)

TEXT: A small pilot vibration installation has been developed and built at the Foundry Laboratory of the Gor'kovskiy politekhnicheskiy institut im. Zhdanova (Gor'kiy Polytechnic Institute im. Zhdanov) to investigate the effects of a number of factors on the property and quality of the metal during vibration pouring, above all on the shrinkage. This installation made it possible to impart circular oscillating movements in the horizontal plane (at variable radius and numbers of revolution) to molds mounted on its table. Circular vibrations have a number of advantages over reciprocal ones, but have not at all been studied yet. During the vibrator operation, each metal particle carries out circular oscillating motions in the horizontal plane. The oscillation amplitude

Card 1/2

The effect of circular horizontal ...

S/123/62/000/002/011/012
A004/A101

λ can be varied within the range of 0 - 3.5 mm, the number of oscillations n amounts to 750, 900 and 1,050 per minute. The vibrator starting time T is also variable. A number of experimental cast-iron pourings were carried out on the vibrator, pouring being effected into dry painted cylindrical molds 100 mm in diameter, 120 - 150 mm high, and 30 mm in diameter, 340 mm high. The n , λ , T , and t -values varied. It was found out that circular vibrations in the horizontal plane show a favorable effect on the improvement of mechanical properties and density of the cast iron poured into dry, painted sand molds. With vibrations, the hardness is more uniformly distributed over the casting cross section than the hardness of specimens poured into immobile molds. The fluidity of the cast iron during vibration pouring into sand molds is higher than during the pouring into immobile molds under the same conditions. Shrinkage defects affecting the casting are considerably reduced over the casting height, and in some cases they can be eliminated in cast iron. Cracks are not observed in the castings. The optimum vibration amplitude during the pouring of cast iron lies in the range of 0.5 - 1.2 mm and depends on the casting frequency and temperature. The optimum frequency under the same conditions amounts to 900 - 1,050 osc/min.

TITLE

Muffling of test stands of aircraft engine plants

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 17, 1961, 36-37.
abstract 171195 ("Gigiyena i sanitariya", 1961, no. 1, 100-104)

TEXT: The noise of modern aircraft engines during starting, adjusting and testing is, concerning the physiological effect, the most disadvantageous. The total noise intensity level in testing cabins amounts to 140-150 decibels and considerably exceeds the threshold of pain. In connection with noise propagation over a long distance, uneasy conditions are caused for the population in districts of test stands and airports. This necessitates to combat the noise by muffling the noise emitted from intake and exhaust pipes and to soundproof the noise passing through the test cabin protection. The permissible total level of the noise intensity and noise spectrum are regulated by definite sanitary standards and regulations. The rated permissible noise level of low-frequency spectral composition is: at the border of residential districts - not exceeding 70 decibels; near noise-emitting apertures - 95-120 decibels. *26* *W*

Card 1/2

Muffling of test stands of aircraft engine plants

cabin - not more than 90-95 decibels. The author describes the layout of a three-shaft box of W-shaped cross section, with two shafts for the suction of the primary and mixing of the secondary outer air to reduce the gas temperature, and one exhaust shaft with directing blades and distributing cascades, balancing the stream, and three double rows of cylindrical silencers suspended in the intake and exhaust shafts. The author gives a brief description of highly efficient silencer types: laminar, honeycomb, cylindrical and tubular. Various materials can be used for silencing: fibrous materials (mineral wool, glass fiber, cotton); loose materials (brick, porous clay and pumice crumbs); monolithic materials (porous ceramics from mineral crumbs with different binders). Fibrous materials possess the highest silencing coefficient, while monolithic materials possess the poorest. The author gives a brief description of the work carried out by him to determine the residual noise spectra of muffled gas-dynamic installations and presents some recommendations on the only permissible relative noise spectrum. There are 1 figure and 2 graphs.

features of local vibration effects on the human body

SOURCE: AMN SSSR. Vestnik, no. 8, 1966, 13-17

TOPIC TAGS: industrial hygiene, industrial medicine, biologic vibration effect, vibration spectrum

ABSTRACT: Since 1962 the Institute of Labor Hygiene and Occupational Diseases has been studying vibration produced by percussion and rotary mechanized hand tools using a spectral analysis method to determine the relation between vibration spectra and clinical symptoms. The article represents a discussion of some 700 vibration spectra of hand power tools used in various industries. The vibration spectral analyses show that the vibrations are characterized by a wide frequency band including both high and low frequency components. High frequency vibrations as well as low frequency vibrations beyond certain levels can induce

vibration sickness. Low frequency vibrations tend to produce vibration sickness affecting the neuromuscular system and the bones and joints. High frequency vibrations tend to produce vibration sickness affecting the vascular system. Continued studies of vibration spectra and their relation to clinical symptoms will provide a basis for establishing maximum permissible vibration levels in different frequency bands. Atomic energy in the national economy; economics and experience of application
(Atomnaya energiya v narodnom khozyaystve; ekonomika i opyt primeneniya),
Moscow, Izd-vo "Ekonomika", 1964, 174 p. illus., bibliog. Errata slip
inserted. 4,500 copies printed.

TOPIC TAGS: atomic energy, economics, radioactive isotope, nuclear power
engineering, radiation effect

PURPOSE AND COVERAGE: This book discusses the problems of the economic effectiveness of the use of atomic energy in domestic and foreign industry and presents data associated with expanded use of atomic energy. On the basis of a large amount of factual material, the book indicates the most economical ways of introducing the use of radioactive isotopes in the national economy. The book recommends safety measures and gives the details of the use of certain types of radioactive sources. The book is intended for engineers, technicians, economists, planners, teachers, and students of higher educational institutions and technicums and a large audience of readers interested in these problems.

EngineerTITLE: On the Calculation of the Carrying Away of Fine-Grained Material From
Reactor Installations With Pseudoliquefied Catalyzer Layers

PERIODICAL:

Khimicheskoye mashinostroyeniye, 1959, Nr 4, pp 19 - 21 (USSR)

ABSTRACT:

The article describes the tests carried out in "Giproneftemash" plant on the carrying away of catalyzer from a four-plate multistage counterflow apparatus 200 mm in diameter with a pseudoliquefied layer. To collect the material carried away, three cyclones were connected successively, 600 mm above the pseudoliquefied layer of the fourth plate. The pseudoliquefied layer was formed on gas-distributing grates (sieves) with holes of 3 mm (4.84%), 5 mm (4.7%) and 5 mm (6.78%), the bracketed figures meaning the relation of the total hole-area to the surface of the apparatus. Air at temperature of 20°C was used as a pseudoliquefying agent. Circulation of solid fine-grained material in the apparatus was performed with a pneumatic lifter. The average circulation of catalyzer was 284 kg/h. Catalyzer carried out of the layer by air stream was taken from the cyclones and after having been weighed was returned into the apparatus.

On the Calculation of the Carrying Away of Fine-Grained Material From Reactor Installations With Pseudoliquefied Catalyst Layers

During the tests samples of pseudoliquefied layer and catalyst, collected by the cyclones, were taken to determine their fractional composition. Sizes of solid particles, making up the fractions, were counted as diameters of equivalent spheres. The average composition of catalysts was as follows: microspherical natural clay catalyst 0.49 mm (2.8%), 0.34 mm (21.40%), 0.234 mm (48.51%), 0.093 mm (21.10%) under 0.093 mm (6.17%); microspherical synthetic catalyst 0.41 mm (24.30%), 0.34 mm (27.50%), 0.27 mm (22.10%), 0.115 mm (22.10%), 0.062 mm (4.00%); ground aluminosilicate catalyst 0.7 mm (6.55%), 0.56 mm (5.77%), 0.45 mm (17.93%), 0.3 mm (29.00%), 0.2 mm (26.20%), 0.0615 mm (21.10%) under 0.0615 mm (3.45%). Experimental data were used to compute the Lyashchenko and Reynolds numbers on the basis of the speed in the free cross-section of the apparatus, and of the weight of spherical particles, equivalent to the largest particles carried away. The air stream speeds in the free cross-section were within 0.3 - 0.6 m/sec.; maximum diameter of particles carried away was 0.03 - 0.2 mm. Diagram 1 represents the relations between Lyashchenko and Reynolds parameters and it shows that the experimental points, independent of both, catalyst type and gas-distributing grate, are grouping near the

On the Calculation of the Carrying Away of Fine-Grained Material From Reactor Installations With Pseudoliquefied Catalyst Layers

theoretical relation. Equations (2) and (3) permit to calculate the maximum diameters of particles, which will be carried away from the apparatus by a gas stream, passing through the pseudoliquefied layer. On diagram 2 the diameter of carried away particles is plotted against gas stream speed. The maximum deviation of the calculated values from the experimental values was for microspherical natural clay catalyst 13.3%, for microspherical synthetic catalyst 28% and for ground aluminosilicate catalyst 33%. The equations derived by the authors are compared with those proposed by L.A. Akopyan and A.G. Kasatkin [Ref 3] and by V.D. Goroshko, R.B. Rozenbaum and O.M. Todes [Ref 4]. Equations (7) - (11) give the same dependence between the maximum diameter of carried away particle on the one hand and the physical parameter of the stream and the specific weight of material on the other hand. Equations (12) - (14) serve to answer the question on the validity of experimental data obtained at low temperatures for industrial type installations with higher temperatures. Calculations carried out for air, ethane, propane and nitric oxide show that a slight change (within 20 - 30%) of the lifting power of gas stream, caused by the change of

its temperature, cannot essentially influence either the fractional composition of fine-grained material carried away, or its weight. In conclusion it is stated that the carrying away of fine-grained material depends only on the speed of the gas stream in the apparatus and the diameter of the particles. Experimental results obtained at low temperatures can be supplied to industrial installations working at high temperatures. There are: 2 sets of graphs, 1 table and 4 Soviet references.
